Adding Fields to a Form

Last Modified on 17/04/2019 1:13 pm AEST

To add fields to a form:

1. Open the Form Builder.
2. Select **+** the Add field icon in Left Navigation Area. The list of fields appears.
3. Select and hold the type of field that you want to add to the object or form.
4. Drag and drop the field to the Form Canvas.
5. Select **SAVE** to save the field to the object and the form.

When you add the fields directly to the form they are vertically stacked. To add fields horizontally across the form, add Containers to the form and then add the fields to the Containers. Adding Containers to the form assists with a better form layout, see Form Layout .

Fields are of different datatypes. Depending on the schema of the application pick the datatype that will be most suitable for the type of field it represents. Field Types explains each of the datatype in detail, see Form Layout .
