

replace

Last Modified on 25/05/2020 1:19 pm AEST

Performs a search and replace over some text and returns the result.

Function

```
result = replace(text, find, replace)
```

Arguments

Argument	Data Type
text	string
find	string
replace	string
result	string

Comments

Finds *find* within *text* and replaces it with *replace*. Note: this does not modify the underlying field - it only returns the resulting text.

Examples

```
result = replace('Old world', 'Old', 'New') /* result = 'New world' */
```
