

End of Support for TLS versions 1.0 and 1.1

Last Modified on 16/04/2024 9:36 am AEST

Overview of the change

Over the past several years, internet standards and regulatory bodies have deprecated or disallowed TLS versions 1.0 and 1.1 for a variety of security issues. In line with this move, Readiness will be ending support for TLS version 1.0 and 1.1 in the Readiness Platform. Instead, Readiness will be supporting TLS version 1.2 which is much more secure than the older versions.

End of Support date

It will no longer be possible to connect to the Readiness platform using TLS 1.0 or TLS 1.1 after 13 June 2024.

What do I need to do?

No action is required if you use the Readiness Platform in the browser. All modern browsers support TLS version 1.2 and will automatically use this for all applications that support TLS version 1.2.

Customers who are using Record APIs to connect to a third party system need to ensure that their client application supports TLS 1.2.
