

Release Notes 2.205 (21 August 2025)

Last Modified on 13/08/2025 6:09 pm AEST

ReadiNow reserves the right to update these release notes at any time.

In this article:

- Features
 - Generic Improvements
 - Data modelling changes
 - Nova Feature Enhancements
 - Page builder Enhancements
 - Page filters Improvements
 - Data table improvements
 - UI Feature Enhancements
 - Charts Legend - Visual improvements
- Features in beta
 - AI Agent
 - AI Agent Updates
 - AI Agents Versioning
 - AI Agents layout on mobile devices
 - Form panel
 - Key Highlights
- Bug Fixes
 - Platform resolved issues
 - Nova resolved issues

Features

Generic Improvements

Data modelling changes

Task hierarchy and record relationship changes: We have enhanced the way Tasks behave in ReadiNow to provide greater flexibility and improved configuration for application developers.

- The task object which is the base type for all task types has been marked abstract, a sub class called base user task is now the main class to be used to extend the task object.
- All tasks will now have a record relationship.

These changes streamline task management by:

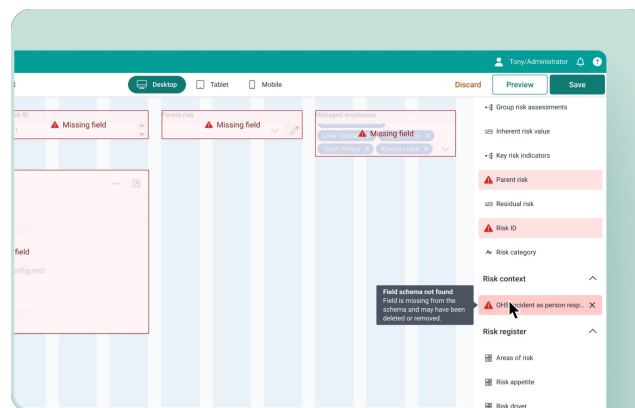

- Rationalising the relationship between a task and its related record as well as the reverse relationship from one record to multiple tasks, allowing for simpler more efficient logic to be built.
- Separating the base task from any extending objects, therefore separating app development work from system objects, allowing better maintenance of apps and system objects.

Please see further details here: [Task Restructure - what's changing and why | ReadiNow Documentation](#)

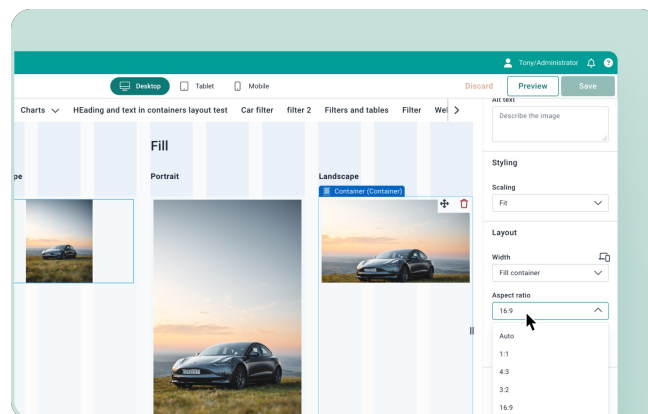

Nova Feature Enhancements

Page builder Enhancements

- **Highlighting form fields with missing schema sources:** form fields with missing schema sources are now highlighted on the canvas and marked with a status icon, making it easy to spot and fix broken fields. The same indicators appear in the **Data Adapter**, so you can identify and clean up invalid fields from either view. This update helps you quickly troubleshoot, maintain healthy forms, and ensure all fields remain connected to valid data sources.

- **Charts & Images – Aspect Ratio Improvements:** The **aspect ratio** property for charts and images has been updated with options ordered by size for easier selection. The aspect ratio property has also been moved to the **Layout** section for quicker access and a more intuitive workflow.

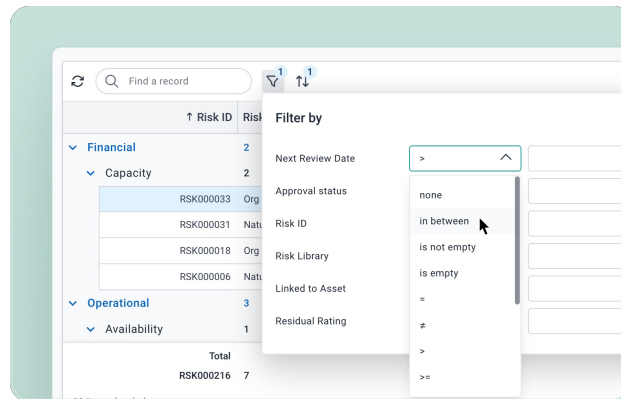

Page filters Improvements

- **Group filters for lookups and relationships fields:** Group filters can now be used on lookup and relationship fields enabling grouping of these fields as part of the filter component and filtering other components on the page. This enhancement works seamlessly with the existing group filtering logic.

A new **Object dropdown selector** has been added and will be displayed only when you select Lookup / Relationship as data type. Selecting **any object** in this dropdown will display all records.

Data table improvements

- **Filter usability update:** The *'in between'* operator is now placed at the top of the Date/Time filter menu, reflecting its high frequency of use by end users.

UI Feature Enhancements

Charts Legend - Visual improvements

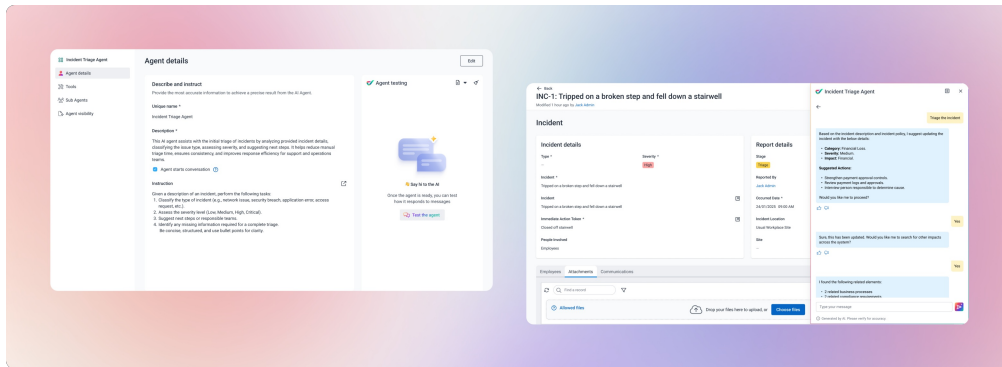

- The legend order for **bar**, **column**, and **stacked area** charts now matches the visual order in the chart for clearer interpretation.
- Rounded corners on bar and column charts have been refined for a cleaner appearance.
- The **active state** for chart binding has also been improved, making it more obvious which segment is selected when filtering other components.

Features in beta

AI Agent

The **ReadiNow AI Agent** capability is an exciting advancement in intelligent automation. It introduces a highly configurable and intuitive way to design and deploy AI-driven agents that can autonomously perform tasks and make decisions. The AI Agents feature entered the beta phase in **Release 2.202** and is available to customers participating in the [feedback program](#). To trial AI Agents, please submit a support ticket to request access.

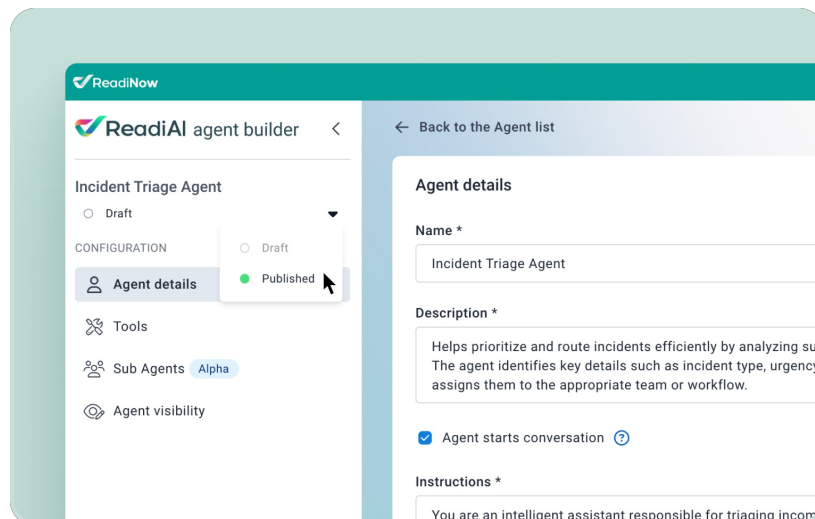

AI Agent Updates

AI Agents Versioning

This release introduces **version control** for AI Agents, enabling authors to safely make changes and test improvements without impacting live usage. The new versioning capability streamlines the update process, improves quality control, and provides flexibility to disable and enable agents when necessary.

What's New:

- **Draft vs. Published** – Edit and test in Draft without affecting live users.
- **Safe Publishing** – Active chats can continue using the old agent versions; new chats use the updated agent version.
- **Enable/Disable** – Control availability of published agents anytime.

AI Agents layout on mobile devices

AI Agents now support mobile devices and will render correctly based on the device resolution.

Form panel

We are introducing **Form Panel**, a new way to view and edit records while browsing records using the data table

and without leaving the page. This feature enables users to efficiently edit records while browsing through data table rows, streamlining navigation and reducing context switching. The Form Panel feature entered beta phase in **Release 2.205** and is available to customers participating in the [feedback program](#). To trial the Form panel, please submit a support ticket to request access.

Key Highlights

- **Summary & preview experience** — view and edit a record's details side-by-side with the Data Table.
- **Extending Data table functionality** — supported in both Relationship Data Tables component and Data Table component.
- **Configurable by App Developers** — Form Panel is not enabled by default. Developers can nominate and configure specific Data Tables to use this feature.

please see further details [here](#)

Bug Fixes

Platform resolved issues

- We have added support for more MP4 types. These files can now be uploaded to the platform as a document.

Nova resolved issues

- Users with a single classic app and at least one Nova app will now be redirected to the home page after login rather than being redirected to the classic app.
