

# Release Notes 2.207 (16 October 2025)

Last Modified on 10/10/2025 11:59 am AEDT

ReadiNow reserves the right to update these release notes at any time.

## In this article:

- Features
  - Go-Live Highlights
    - Form panel
  - General Enhancements
    - Securing the ReadNow documentation
  - Nova Feature Enhancements
    - Nova Generic Enhancements
    - Page Runner Enhancements
- Features in Beta
  - AI Agent
  - AI Agent Updates
    - Enhanced Update Tool for Relationship Fields
  - AI Workflow Activities
- Bug Fixes
  - Nova resolved issues
  - Process resolved issues
  - Platform resolved issues

## Features

### Go-Live Highlights

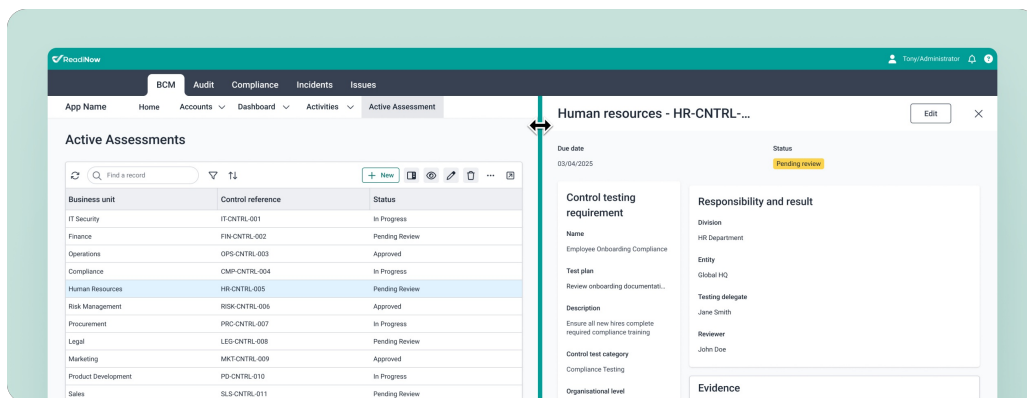

#### Form panel

We are introducing **Form Panel**, a new way to view and edit records while browsing records using the data table and without leaving the page. This feature enables users to efficiently edit records while browsing through data table rows, streamlining navigation and reducing context switching. The Form Panel feature is now released for general availability for all customers.

#### Key Highlight

- **Summary & preview experience** — view and edit a record's details side-by-side with the Data Table.
- **Extending Data table functionality** — supported in both Relationship Data Tables component and Data Table component.
- **Configurable by App Developers** — Form Panel is not enabled by default. Developers can nominate and configure specific Data Tables to use this feature.

please see further details [here](#)

## General Enhancements

### Securing the REDI NOW documentation

To better protect our intellectual property and provide a more secure experience, the REDI NOW documentation will now be split into public and secured areas:

- **Some content will remain public:** A limited set of articles will still be available without login.
- **Most content will be secured:** You'll need to log in via the REDI NOW platform to access the full documentation library.

When you access help documentation from within the REDI NOW platform by following the in-app links, you will be seamlessly redirected to the REDI NOW documentation with the appropriate permissions and have access to the full set of documents.

If you attempt to access a secured article directly (without being logged in), you will see instructions guiding you to authenticate before accessing the secured content.

## Nova Feature Enhancements

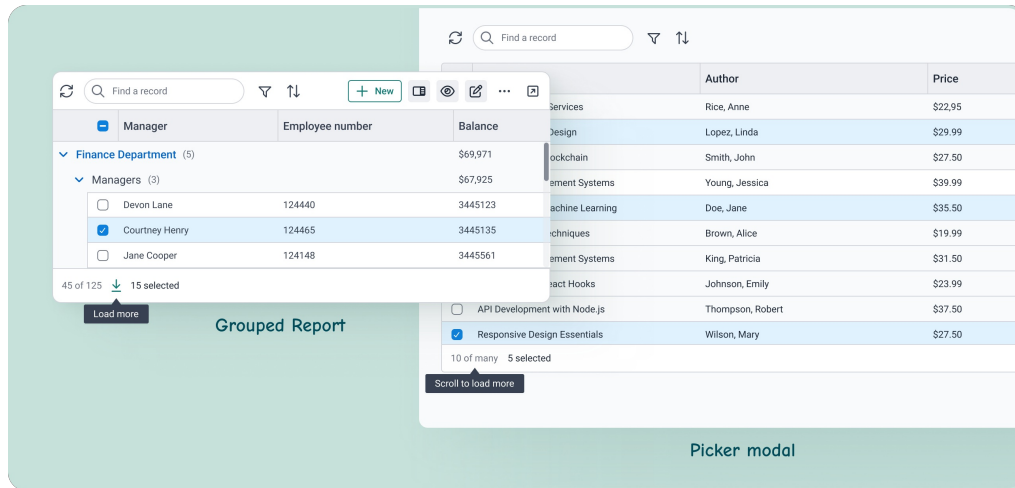

### Nova Generic Enhancements

**Default Login Location:** It is now possible to configure a Nova page as a default login location per user under **Administration | User Accounts**. Once configured, end users will get redirected to the selected Nova page after logging in to the REDI NOW platform. This capability was previously available only in Classic.

### Page Runner Enhancements

**Data tables footers updates:** There have been several updates to data table footers, as follows:

- **Grouped Reports:** Footers now show how many rows are loaded out of the total, with a **Load More** button to see more data.
- **Picker modal:** The picker modal accessible from lookup fields and relationship fields now displays footer including number of loaded rows and total rows. The footer update as you scroll, and shows selected row counts.
- **Drill-Through:** When drilling into data from charts or components, the generated report now opens in full view with the updated footer and using live scroll.

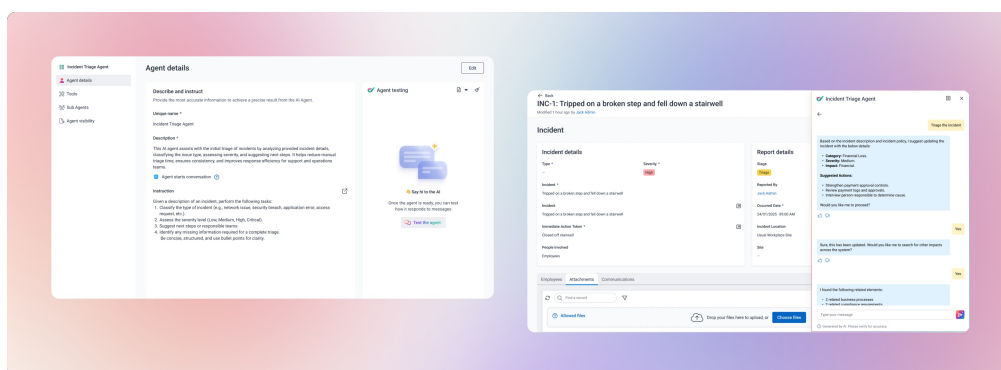

**Triggering workflows on multiple records:** Workflows with a record list input parameter can now be triggered from a Nova data table by selecting either one or multiple records. To enable this capability:

- Verify that the workflow has a record list input parameter for the specific record type.
- Set the workflow as an action in report builder.
- End users can now trigger the workflow from the page runner.

## Features in Beta

### AI Agent

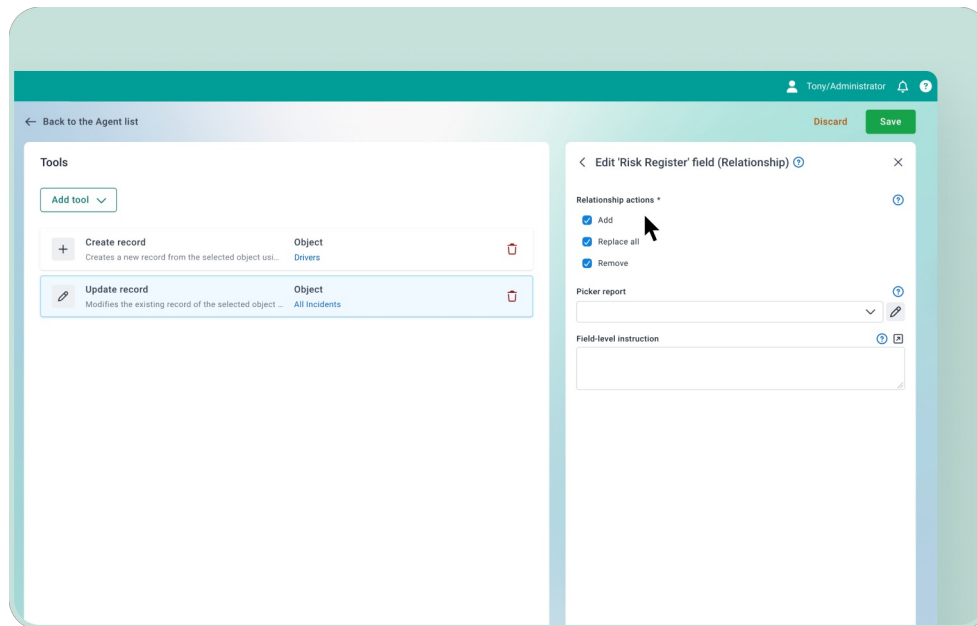

The **ReadiNow AI Agent** capability is an exciting advancement in intelligent automation. It introduces a highly configurable and intuitive way to design and deploy AI-driven agents that can autonomously perform tasks and make decisions. The AI Agents feature entered the beta phase in **Release 2.202** and is available to customers participating in the [feedback program](#). To trial AI Agents, please submit a support ticket to request access.

### AI Agent Updates

#### Enhanced Update Tool for Relationship Fields

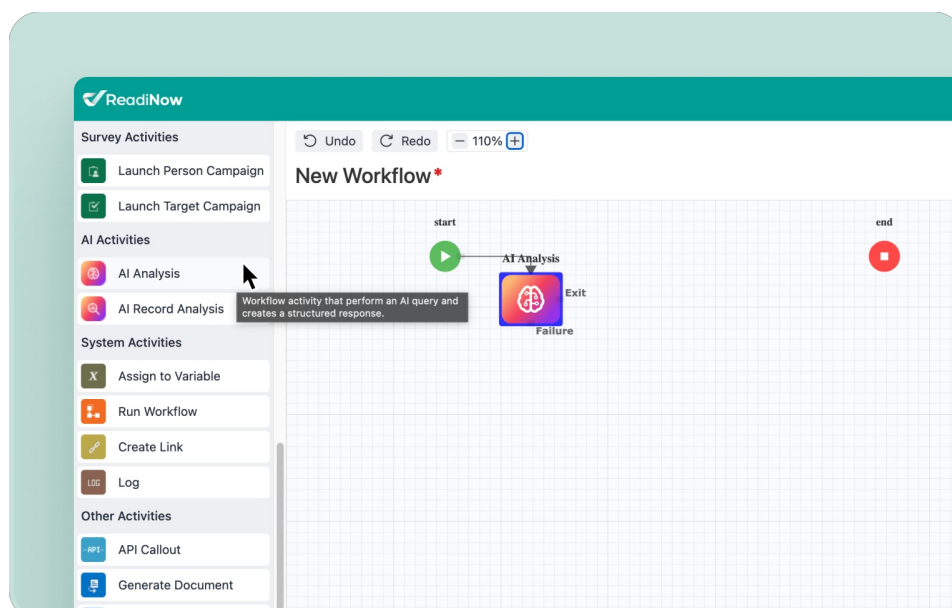

The Update tool now offers improved configuration options for relationship fields. When including relationship fields in scope, Agent developers can now specify whether users are permitted to add, replace, and/or remove related records during record update processes

## AI Workflow Activities

AI Workflow activities are now available (beta) for usage by ReadNow customers, AI Workflow activities enable running an LLM operation as part of a workflow with a defined set of inputs and outputs. This enables harnessing the power of AI as part of business process automation. Two workflow activities are released as part of this release:

- **AI Analysis:** This activity allows a workflow to send data and a question to an LLM, and receive a structured response. It's useful for extracting insights, classifying data, or generating suggestions as part of an automated process. See more details [here](#).
- **AI Record Analysis:** This activity allows a workflow to send a list of records and a question to an LLM, and receive a list of responses, one response per record. It's useful for analysing lists of records, categorising lists of records or taking actions based on lists of records as part of an automated process, and supports potentially large lists of records (not directly bound by the context buffer size). See more details [here](#).

# Bug Fixes

## Nova resolved issues

- Conditional formatting for choice fields on reports will now be displayed correctly ignoring the form configuration.
- Workflow navigate activities that open a Nova form will now show a breadcrumb, allowing better navigation after the activity is completed.
- Date filter on Nova reports now works if the date is keyed in or selected in the date modal.
- The filter “Last N Days until now” and “Last N Days from now” will now behave correctly, taking into account the current time in filtering the report

## Process resolved issues

- Process expressions can now use variables from skipped steps or failed steps.

## Platform resolved issues

- Columns with negative values will be exported as decimal fields when exported to csv, previously these were exported incorrectly as text
