

Process Triggers

Last Modified on 12/03/2026 11:38 am AEDT

Administrators can set up Process Triggers that can launch a process based on object creation or update.

The screenshot shows the 'Process triggers' screen in the ReadNow application. The interface includes a sidebar with navigation options: Administration, Applications, Audit, Metrics, Notifications, Process, Processes, Process Runs, Process Step Tasks, and Process Triggers. The main content area displays a table with the following data:

Trigger name	Process to run	Object to trigger on	Enabled	Conditional	Triggered on
Trigger on Game Update	Game Purchase Validation Process	Game Record	Yes	No	Create Or Update
Trigger on Update of State	Simple Enrolment Process	Game Record	Yes	No	Update
Change of Format of game to trigger...	Student Onboarding Process	Game Record	Yes	No	Update

Below the table, there is a pagination indicator showing '1-3 of 3'.

Within the Process Triggers screen Administrators can view, create, edit, and delete process triggers, with advanced filtering and search capabilities.

You can also

- Define triggers on record creation or update, including support for field and relationship-based triggers.
- Expression-based run conditions for triggers.

NOTE A process cannot trigger itself on the same record to prevent infinite loops of Process creation.
